

CloseAndKeep setup for a custom CRM

For **Zack** (account + API key) and **Claude** (the changes to your CRM).

CloseAndKeep does not have a one-click “Connect” button for home-grown CRMs. Salesforce and HubSpot use OAuth on the Integrations page. A custom CRM connects with an **API key** and two HTTP calls: create a prospect, then create a cookie order.

Public site: <https://www.closeandkeep.com>

API host: <https://api.closeandkeep.com>

API docs: <https://www.closeandkeep.com/developers>

Part 1 — Zack: create your CloseAndKeep account

Do this in a browser. Do **not** use “Continue as guest.” Guest sessions cannot create API keys or keep your history.

Step 1. Open the website

Go to <https://www.closeandkeep.com>.

In the top right, click the brown **Get started** button. You can also click **Get started** under the headline.

Step 2. Create an account

You land on **Create account** (`/signup`).

Create account

Start tracking prospects and gifts follow-ups in one place.

Name

Company

Email

Password

Confirm password

Already have an account? [Sign in](#)

CloseAndKeep gifting follow-up for customer teams.

[Home](#) [Pricing](#) [API](#) [Support](#) [Contact](#) [Privacy](#) [Terms](#)

[f](#) Facebook [in](#) LinkedIn

Fill in:

Field	Rules
Name	Required
Company	Required
Email	Use an inbox you can open now
Password	At least 12 characters , with at least one letter and one number
Confirm password	Must match

Click **Create account.**

Step 3. Verify your email

You are sent to **Check your email.**

Check your email

We sent a verification link. Confirm your email to access your dashboard.

Email

Resend verification email

Already verified? Sign in

1. Open the message from CloseAndKeep.
2. Click the verification link.
3. If nothing arrives, enter the same email and click **Resend verification email**. Check spam.

Until you verify, you cannot sign in to the dashboard.

Step 4. Sign in

Go to <https://www.closeandkeep.com/login> (or click **Log in** on the homepage).

The image shows a login form for CloseAndKeep. At the top is the CloseAndKeep logo. Below it is the heading "Login" and a subtext "Sign in to access your CloseAndKeep dashboard." There are two input fields: "Email" and "Password". Below these is a dark blue "Sign in" button. Under the button is a horizontal line with "OR" in the center. Below the line is a light blue "Continue as guest" button. Below the button is a paragraph of text: "Guest sessions are temporary; you must enter the shipping address yourself; reminders and integrations are unavailable, and you can't restore this session later. [Create an account](#) to keep your history." Below this is another line of text: "Need an account? [Create one](#) · Need the marketing site? [Go home](#)". At the bottom of the page is a footer with the text "CloseAndKeep gifting follow-up for customer teams." and a navigation menu: "Home Pricing API Support Contact Privacy Terms". Below the navigation menu are social media links for Facebook and LinkedIn.

Guest sessions are temporary; you must enter the shipping address yourself; reminders and integrations are unavailable, and you can't restore this session later. [Create an account](#) to keep your history.

Need an account? [Create one](#) · Need the marketing site? [Go home](#)

CloseAndKeep gifting follow-up for customer teams.

[Home](#) [Pricing](#) [API](#) [Support](#) [Contact](#) [Privacy](#) [Terms](#)

[Facebook](#) [LinkedIn](#)

Enter your email and password, then click **Sign in**.

Skip **Continue as guest**. Guests cannot create API keys, and the session cannot be restored later.

Step 5. You land on the Dashboard

After a full signup, the left nav includes **Dashboard**, **Prospects**, **Orders**, **Follow-ups**, **Integrations**, **Payments**, **API keys**, and **Profile**.

(The screenshot above is a guest preview of the same layout. On your real account you will not see “Guest session,” and API keys / Integrations appear in the left nav.)

Optional but useful: open **Profile**, click **Upload photo**, and add a JPEG/PNG/WebP (up to 2 MB). Recipients can see that photo on gift emails.

Step 6. Create an API key (this is the CRM connection)

In the left nav, click **API keys**.

The screenshot shows the 'API keys' page in the CloseAndKeep interface. On the left is a sidebar with navigation links: Dashboard, Prospects, Orders, Payments, and Profile. The main content area is titled 'API keys' and includes a brief explanation: 'Create keys so agents or scripts can open gift orders. Payment still happens on Stripe. Checkout card data never hits CloseAndKeep.' Below this, it says 'Request examples: API docs.' A pink error message states 'Guest accounts cannot manage API keys.' The 'Create an API key' form has a 'Label' field with the placeholder 'e.g. CRM agent' and a 'Create key' button. Below the form, it shows 'ACTIVE KEYS (0)' and 'No active keys yet.' At the bottom left, there is a 'Guest session' notice and a 'Logout' button.

1. Under **Create an API key**, set **Label** to something like `Zack CRM`.
2. Click **Create key**.
3. Copy the full key immediately. It starts with `cak_` and is shown **only once**.
4. Store it like a password (password manager or your CRM's secret/env settings). Do not put it in a public git repo or a screenshot.

If you lose it, revoke the old key and create a new one.

Creating an API key unlocks **Monthly billing** on **Profile**. You can still pay per order if you skip the next step.

Step 7. (Optional) Pay monthly instead of per order

Open **Profile**. After Step 6 you should see **Monthly billing**.

1. Click **Add card** and save a card on Stripe Checkout (card numbers stay with Stripe).
2. Check **Pay monthly**.
3. Optionally set a **Max spending limit**.

When Pay monthly is on, **Send cookies** in your CRM will **not** return a Checkout link. Orders accrue and the saved card is charged at month end. You can still **Pay now** on Profile anytime.

If you leave Pay monthly off, each Send cookies click returns a Stripe Checkout URL the rep opens to pay.

Step 8. Skip the Salesforce / HubSpot buttons

Integrations is only for Salesforce and HubSpot OAuth. Your custom CRM should **not** click **Connect Salesforce** or **Connect HubSpot**.

Your connection is the API key from Step 6.

Step 9. (Optional) Send one test gift by hand

Before wiring the CRM, confirm the account works:

1. **Prospects** → add a name and email → **Add prospect**.

Prospects
People and companies you're actively working.

Name: Alex Rivera Email: alex@company.com Add prospect

NAME	EMAIL
No prospects yet Add someone above, then send cookies after your next pitch. Or start a gift order →	

Guest session
Orders you place are kept for shipping. This session won't come back, and follow-ups are unavailable.
Create a full account →
Logout

- Orders → Send cookies (or New cookie order).**
- Choose **4 cookies** or **12 cookies**, add a note, and either enter street / city / state / ZIP or leave them blank so CloseAndKeep emails the recipient for it.
- Pay on Stripe Checkout.

New cookie order
Pick prospect and cookie count, then delivery details. Prefer a spreadsheet? Import a CSV instead.

Import CSV

1. Prospect & cookies 2. Shipping & note 3. Review

Prospect
No prospects available

Order will be tied to this prospect. Follow-ups and outcomes stay on the prospect record.

Number of cookies
4 cookies \$64.00 12 cookies \$65.00

You pay once at Stripe checkout when you submit.
Order total: \$64.00

Add a prospect to continue
Orders are tied to a prospect so you can track outcomes later.

Name
Alex Rivera

Guest session
Orders you place are kept for shipping. This session won't come back, and follow-ups are unavailable.
Create a full account →
Logout

When that works, give Claude the API key and Part 3 below.

Part 2 — What your CRM should look like

Keep reps in your CRM. Do **not** add a CloseAndKeep deal stage — stages are already used for forecasting and other automations. Use a **Send cookies** button instead.

Fields to add (on the deal / opportunity)

Field (label in the CRM)	Suggested internal name	Type	Required?	Used for
Cookie note	<code>cookie_note</code>	Long text	Strongly recommended	Personal message on the gift. If blank, use: <code>Thanks for meeting with us – enjoy these cookies!</code>
Cookie street	<code>cookie_street</code>	Text	Optional*	Street address
Cookie street 2	<code>cookie_street2</code>	Text	Optional	Apt, suite, unit
Cookie city	<code>cookie_city</code>	Text	Optional*	City
Cookie state	<code>cookie_state</code>	Text	Optional*	2-letter state (e.g. <code>IL</code>)
Cookie postal code	<code>cookie_postal_code</code>	Text	Optional*	ZIP / postal code
Cookie pack	<code>cookie_pack</code>	Picklist	Optional	<code>cookies-4</code> or <code>cookies-12</code> . Default 4 cookies .
CloseAndKeep prospect id	<code>cak_prospect_id</code>	Number / text	Store after first API call	Avoid creating duplicate prospects

*Street, city, state, and postal code are required **together**. If all four are blank, CloseAndKeep emails the recipient a link to enter shipping. Do not concatenate them into one long-text field.

Button to add

Add a **Send cookies** button on the deal detail page, next to the cookie fields. This is the only trigger. Do not fire from a stage change, and do not add a Demo Completed stage.

The button should:

1. Sit on the deal (or opportunity) record so a rep can click it without leaving the CRM.
2. Label: **Send cookies**. If this deal already created an order, label it **Send cookies again** and confirm before creating another.
3. On click: disable the button, show “Sending...”, then call CloseAndKeep (prospect, then gift order).
4. After success:
 - If the response includes `checkout_url` → show a **Pay for cookies** link that opens that URL (new tab).

- If `checkout_url` is null → monthly billing is on. Show success such as "Cookies queued — billed monthly on CloseAndKeep." Do **not** treat null as an error.

5. If contact name or email is missing, show an error and do not call the API.

Also make sure the deal has a **contact name** and **contact email**. Email is required to create a prospect, and it is how we request a shipping address when street/city/state/ZIP are blank.

What happens when they click Send cookies

1. Your CRM creates (or reuses) a CloseAndKeep **prospect**.
2. Your CRM creates a **gift order** with the note and street/city/state/ZIP (or address-request).
3. If Zack pays **per order**, CloseAndKeep returns a **Stripe Checkout URL**. The CRM shows **Pay for cookies**.
4. If Zack turned on **Pay monthly** in CloseAndKeep Profile, `checkout_url` is null. The order is queued and billed at month end. The CRM should show success, not an error.

Card numbers never go through your CRM or the CloseAndKeep API.

Paid (or monthly-owed) orders move toward fulfillment (`queued` after payment, or after monthly authorization).

Part 3 — Paste this into Claude (CRM code changes)

Copy everything in the box below into Claude in the CRM repo.

```
You are updating our custom CRM so that when a rep clicks a "Send cookies" button on a deal, we create a CloseAndKeep cookie gift via their HTTP API. Do NOT trigger this from a deal stage change. Stages are used for other automations.
```

```
## Product rules
```

```
- Base URL: https://api.closeandkeep.com
- Auth: Authorization: Bearer <API_KEY> (key starts with cak_)
- Content-Type: application/json
- Do NOT send or store credit card numbers. Payment is Stripe Checkout per order, or monthly billing on the CloseAndKeep Profile (saved card). Never charge a card from the CRM.
- Do NOT use Salesforce/HubSpot OAuth. Custom CRMs use API keys only.
- Live docs: https://www.closeandkeep.com/developers
- Gift ids: cookies-4 (default) or cookies-12. Confirm prices with GET https://api.closeandkeep.com/gifts (public, no auth).
```

```
## CRM fields to add (if missing)
```

```
On Deal/Opportunity:
```

```
- cookie_note (long text)
- cookie_street, cookie_city, cookie_state, cookie_postal_code (text; optional together)
- cookie_street2 (text, optional apt/suite)
- cookie_pack (cookies-4 | cookies-12, default cookies-4)
- cak_prospect_id (store the integer id returned by CloseAndKeep)
```

UI: create a Send cookies button (required)

This is the main product change. Add it even if the cookie fields already exist.

On the deal/opportunity detail page, next to Cookie note / address:

1. Add a primary button labeled ****Send cookies****.
2. Place it on the deal record. Do not hide it behind a stage change or a workflow that fires when stage changes.
3. Do NOT add a "Demo Completed" (or any CloseAndKeep) deal stage.
4. Optional: cookie_pack dropdown next to the button (4 cookies / 12 cookies). Default cookies-4.
5. On click:
 - If contact name or contact email is missing, show an error and stop.
 - Disable the button and show "Sending...".
 - Call POST /prospects (or reuse cak_prospect_id), then POST /gift-orders.
 - Re-enable the button when the request finishes.
6. After a successful create:
 - If checkout_url is a string: show a ****Pay for cookies**** button/link that opens checkout_url in a new tab.
 - If checkout_url is null: monthly billing is enabled on the CloseAndKeep account. Show a success message: "Cookies queued – billed monthly on CloseAndKeep." Do NOT treat null checkout_url as an error.
7. If this deal already created a CloseAndKeep order, change the label to ****Send cookies again**** and confirm before creating another order.
8. Surface API error bodies (400/401/404/429) next to the button.

Need contact name + contact email on the deal.

API flow

1) Create or reuse a prospect

If cak_prospect_id is already set, skip this call and use that id.

POST /prospects

```
{
  "name": "<contact full name>",
  "email": "<contact email>",
  "deal_status": "open"
}
```

Response includes integer "id". Save it on the deal as cak_prospect_id.

deal_status allowed values: open | won | lost.

2) Create the gift order

POST /gift-orders

If cookie_street, cookie_city, cookie_state, and cookie_postal_code are all filled:

```
{
  "prospect_id": <cak_prospect_id>,
  "gift_id": "cookies-4",
  "recipient_name": "<contact full name>",
  "shipping_street": "<cookie_street>",
  "shipping_street2": "<cookie_street2 or omit>",
  "shipping_city": "<cookie_city>",
  "shipping_state": "<cookie_state>",
  "shipping_postal_code": "<cookie_postal_code>",
}
```

```
"note": "<cookie_note or default>"
}
```

If those address fields are blank (CloseAndKeep emails the recipient for shipping):

```
{
  "prospect_id": <cak_prospect_id>,
  "gift_id": "cookies-4",
  "recipient_name": "<contact full name>",
  "note": "<cookie_note or default>",
  "request_recipient_address": true,
  "recipient_email": "<contact email>"
}
```

Default note if cookie_note is blank:

"Thanks for meeting with us – enjoy these cookies!"

note and recipient_name must not be blank/whitespace.

gift_id must be cookies-4 or cookies-12.

3) Show checkout or monthly success

The create-order response includes checkout_url (string or null).

- If checkout_url is set: show a "Pay for cookies" button/link that opens it in a new tab.
- If checkout_url is null: monthly billing is on. Show success ("Cookies queued – billed monthly"). Do not error.
- Do not try to charge a card via the API.
- Optionally poll GET /gift-orders/{id} for payment_status and status.
- After per-order payment succeeds, status becomes queued. Monthly orders use payment_status "owed" until the month-end charge.

Implementation notes

- Store the API key in env/secrets (e.g. CLOSEANDKEEP_API_KEY). Never commit it.
- Fire only when the user clicks "Send cookies". If an order was already created for this deal, do not create another unless they click "Send cookies again".
- Surface API error bodies to the user (400/401/404/429).
- 401 = bad/revoked key. 404 on gift-orders usually means bad prospect_id.
- Endpoints are rate-limited; backoff on 429.
- Optional: after the gift is sent, PATCH /prospects/{id} with deal_status "won" or "lost" when the CRM deal closes.

Manual test

1. Open a test deal with name, email, cookie_note, and either street/city/state/ZIP or blank address fields. Confirm a **Send cookies** button is visible on the deal (not a stage change). Click it.
2. Confirm a prospect appears at <https://www.closeandkeep.com/prospects>
3. Confirm an order appears under Orders.
4. If checkout_url is set, open it and complete Stripe Checkout. If checkout_url is null, confirm the CRM shows monthly-queued success (not an error).

Live request examples (same as [the API page](#)):

API

Create prospects and gift orders from an agent or script. CloseAndKeep returns a Stripe Checkout URL a human completes payment. Card numbers never touch your key or our API.

How it works

1. Sign in and create a key under API keys in the dashboard.
2. Call the API with `Authorization: Bearer cak_...`. Keys cannot call admin routes; create/order endpoints are rate-limited.
3. Create a prospect, then a gift order. Open the returned Checkout URL to pay.
4. After payment succeeds the order becomes queued for fulfillment (manual today; bakery API can plug in later without changing this flow).

Base URL

API host: <https://api.closeandkeep.com>

Public site: <https://closeandkeep.com>. Gift ids: cookies-4, cookies-12 (confirm live prices with `GET /gifts`).

Create a prospect

```
curl -s -X POST "https://api.closeandkeep.com/prospects" \
-H "Authorization: Bearer cak_YOUR_KEY" \
-H "Content-Type: application/json" \
-d '{
  "name": "Dana Buyer",
  "email": "dana@acme.example",
  "deal_status": "open"
}'
```

Create an order + Checkout URL

```
curl -s -X POST "https://api.closeandkeep.com/gift-orders" \
```

Base URL

API host: <https://api.closeandkeep.com>

Public site: <https://closeandkeep.com>. Gift ids: cookies-4, cookies-12 (confirm live prices with `GET /gifts`).

Create a prospect

```
curl -s -X POST "https://api.closeandkeep.com/prospects" \
-H "Authorization: Bearer cak_YOUR_KEY" \
-H "Content-Type: application/json" \
-d '{
  "name": "Dana Buyer",
  "email": "dana@acme.example",
  "deal_status": "open"
}'
```

Create an order + Checkout URL

```
curl -s -X POST "https://api.closeandkeep.com/gift-orders" \
-H "Authorization: Bearer cak_YOUR_KEY" \
-H "Content-Type: application/json" \
-d '{
  "prospect_id": 123,
  "gift_id": "cookies-4",
  "recipient_name": "Dana Buyer",
  "shipping_address": "123 Main St\Springfield, IL 62704",
  "note": "Thanks for the great meeting!"
}'
```

Response includes `checkout_url`. Open it in a browser to pay. Poll `GET /gift-orders/{id}` for `payment_status` and status.

What this API does not do

- It does not accept or store credit card numbers.
- It does not charge a saved card without Checkout (that would be a later option).
- It does not call the bakery yet paid orders queue for fulfillment so a vendor API can be added without changing how partners create orders.

Part 4 — Test the connection

1. In your CRM, open a test deal with a real contact name and email you control.

2. Fill **Cookie note**. Leave street / city / state / ZIP blank the first time (tests the “email them for shipping” path).
3. Click **Send cookies** (the button on the deal — not a stage change).
4. If you are paying per order, confirm the CRM shows a **Pay for cookies** / Checkout link and complete Stripe Checkout.
5. If you turned on **Pay monthly**, confirm the CRM shows queued/billed-monthly success (no Checkout link).
6. In CloseAndKeep, open **Prospects** and **Orders** and confirm the records exist.
7. Confirm the recipient gets the address-request email (if address was blank).

If the CRM call fails, check:

- The key starts with `cak_` and was not revoked.
- You are calling `https://api.closeandkeep.com` (not the website origin).
- `prospect_id` is the integer from `POST /prospects`.
- `gift_id` is exactly `cookies-4` or `cookies-12`.
- `note` is not empty.
